

What is life?

Life is a pattern in space-time, rather than a material object.

Attributes of life

Reproduction

Recombining instruction sets.

Metabolism

Interacts with the environment.

Stability under perturbations

The ability to evolve.

Life requires a critical level of complexity.

*Life is not a highly
improbable chance event,
but almost inevitable.*

*Value of this concept is that it
suggests that chemical
evolutionary systems may be
experimentally testable.*

Stuart Kauffman

Biological systems and physical/chemical systems are substantially different.

Adaptation and Evolution

Biological systems are shaped by natural selection to assure survival and maximize chances for reproduction, while physical systems are not “goal-oriented”.

Self-organization

“A system in which structure appears without external pressure”

- *Results from interactions between components.*
- *Organization can evolve in time or space.*
- *May be stable or transient.*

Complexity itself triggers self-organization

(Kauffman)

How simple can life be?

Not Cells

- **Virus** = RNA or DNA wrapped in protein coat (HIV, poliomyellitis)
- **Viroid** = Tightly wound DNA or RNA (coconut cadang cadang, bunchy top)
- **Prions** = 1/100 to 1/1000 the size of a virus, composed of proteins (Scapies, Multiple Sclerosis, Lou Gehrig's disease)

Phytoplasma and Mycoplasma = simplest cell, lack a cell wall, DNA for 200 functions (walking pneumonia)

Pneumonia mycoplasma

A Single Molecule Census of the Cell

(E)

(F)

Big Picture

We have $\sim 10^{20}$ cells .

Each has a complete instruction set (the genome).

Not all genes are expressed in a cell.

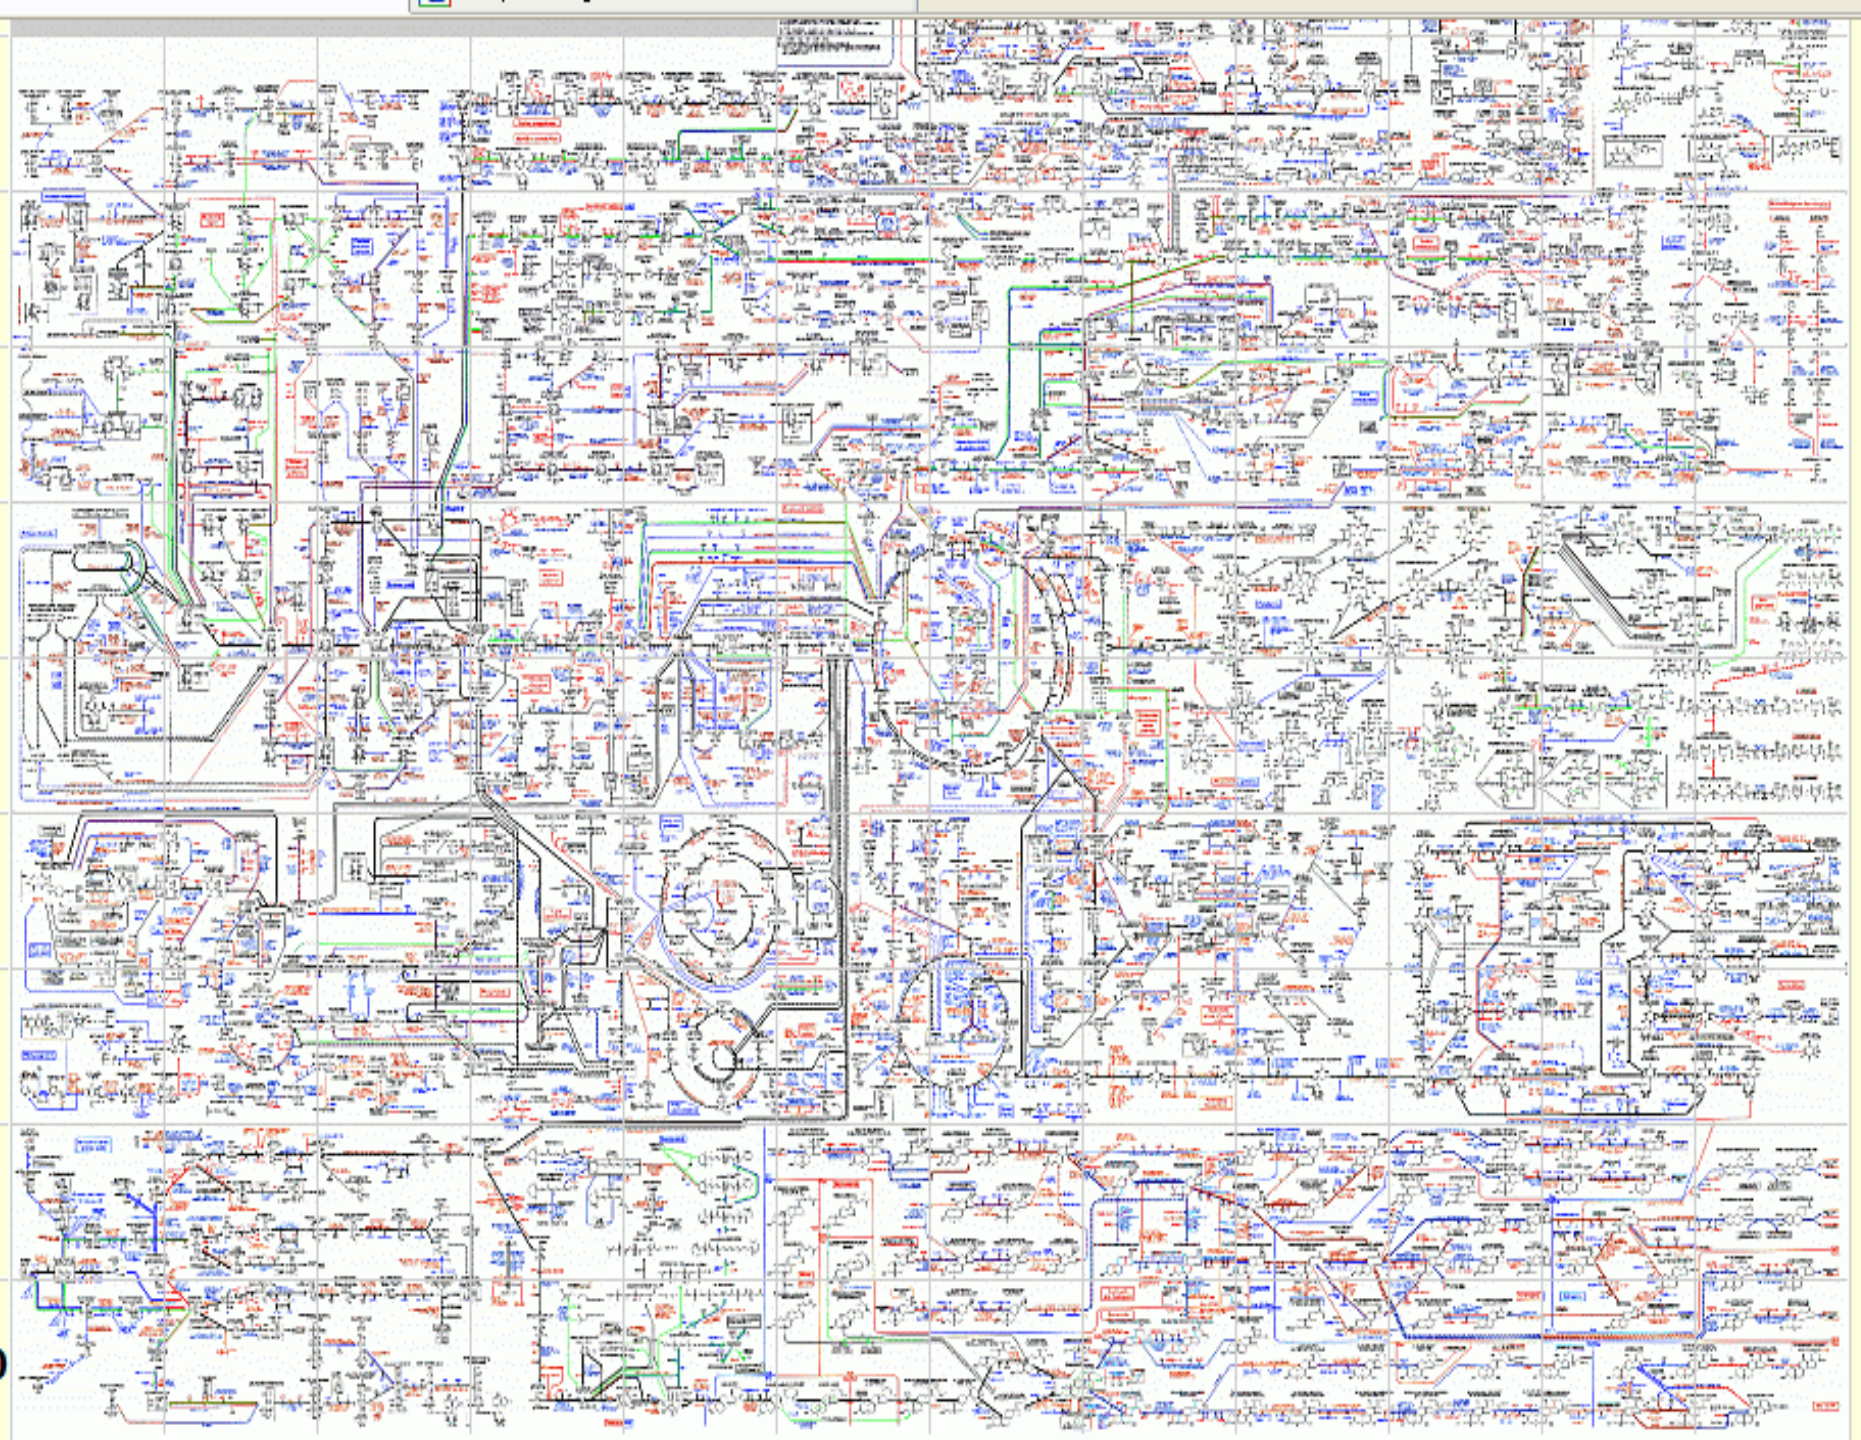

Unlike atoms and simple molecules studied in chemistry and physics, no two cells are identical.

Homeostasis

Networks of interconnecting systems that use antagonistic interplay making them stable to internal-external changes.

Selected cell parameters

Description	Units	Symbol	Value
Energy of ATP hydrolysis		ΔG_{ATP}	21 $k_B T$
Cytoplasmic pH*		pH_c	7.0–7.5
Cytoplasmic sodium concentration	mM	Na_c^+	15
Cytoplasmic potassium concentration	mM	K_c^+	140
Cytoplasmic chloride concentration	mM	Cl_c^-	4
Cytoplasmic ATP concentration	mM	ATP_c	5
Cytoplasmic ADP concentration	mM	ADP_c	0.1
Cytoplasmic phosphate concentration	mM	P_c	5
Cytoplasmic calcium concentration	M	Ca_c^{2+}	10^{-7}
Extracellular sodium concentration	mM	Na_e^+	145
Extracellular potassium concentration	mM	K_e^+	5
Extracellular chloride concentration	mM	Cl_e^-	110
Extracellular calcium concentration	mM	Ca_e^{2+}	2.5–5
Extracellular phosphate concentration	mM	P_e	1
Bilayer capacitance	$\mu\text{F}/\text{cm}^2$	C_0	1
Golgi complex buffering capacity	mM/pH	β_G	10, 40
ER buffering capacity	mM/pH	ER	6
Endosome buffering capacity	mM/pH	EN	50
Chloride permeability	cm/s	P_{Cl}	1.2×10^{-5}
Proton permeability	cm/s	P_p	$4.8\text{--}0.67 \times 10^{-3}$
Golgi complex volume	cm^3	V_G	6×10^{-12}
Endosome volumes	cm^3	V_{EN}	$88\text{--}0.7 \times 10^{-15}$
Golgi complex surface area	cm^2	S_G	8×10^{-6}
Endosome surface area	cm^2	S_{EN}	$1\text{--}0.06 \times 10^{-8}$

Cells as Organized Machines

Cells are computational devices.

Cells have instructions and programs too:

- *Genome (DNA) contains the instructions.*
- *Proteins are executables (strings of amino acids).*

Homeostasis is maintained by directional flows

Matter

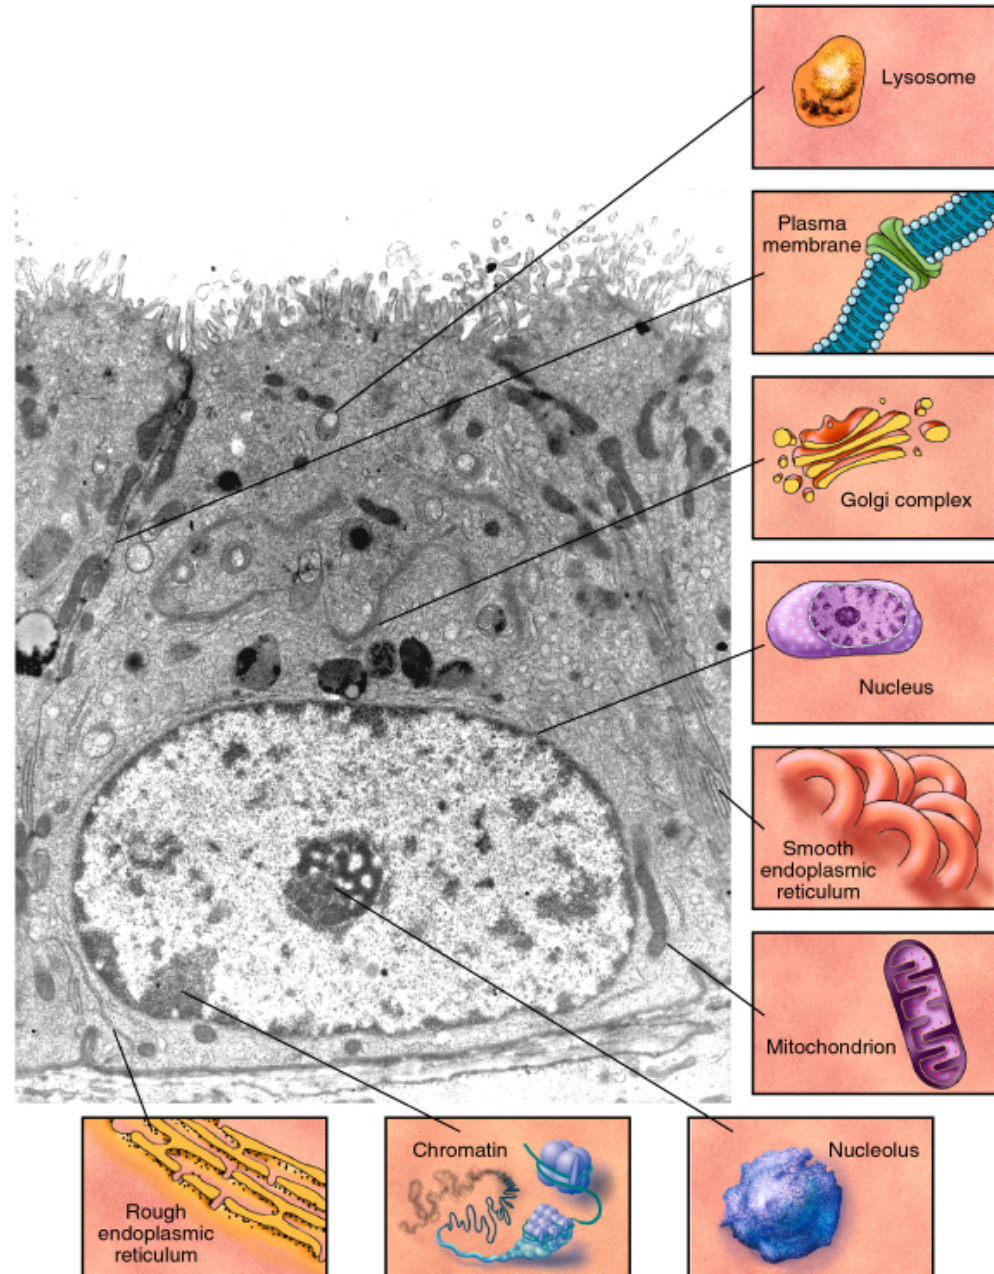

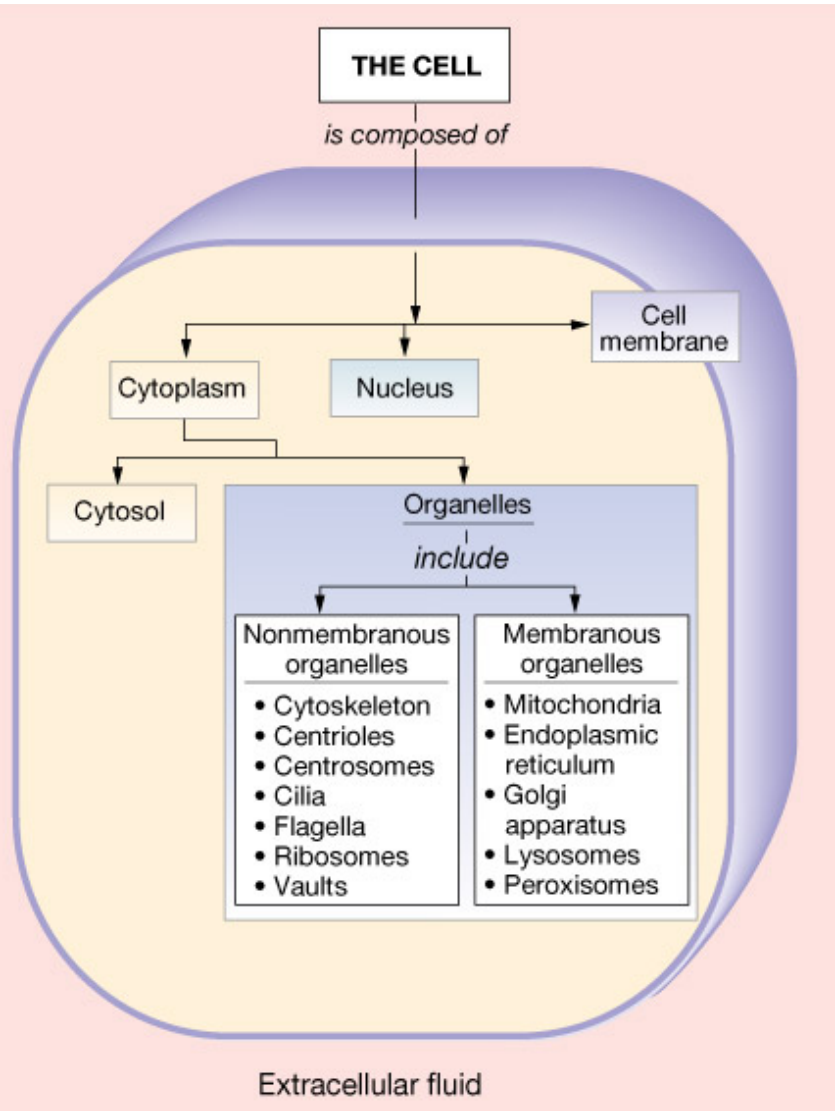

Information

Energy

Space compartmentalization

Crowding !!!!

Biochemical reactions in living systems take place in media containing 50–400 mg/ml of macromolecules.

*The numbers of different
molecular actors in the drama
matters!*

*Concentration might just be
the most important variable in
biochemistry!*

Macromolecular crowding effects

David S. Goodsell

Effect of crowding on diffusion

*diffusion of small
solute unaffected*

*diffusion of large solute
strongly slowed down*

Biological Design

*There is a recurring patterns of **spirals**, **triangulated forms**, & **pentagons** in everything from **crystals** to **proteins**, **viruses** to **plankton**.*

***TENSEGRITY** is a fundamental aspect of self-assembly
- an architectural system, mechanically stable, yet
dynamic, where the forces of tension and compression
balance.*

*Tensegrity may be the most
economical and **efficient** way
to build cell structure.*

*Cellular
information
processing and
passing are carried
out by networks of
interacting
molecules.*

*from Downward,
Nature, August (2001)*
